

# "Day 3 - API Integration Report - Food Chukh"

## 1. API Integration Process

- **Project Setup:** The project was initiated using create-next-app.
- **Sanity Integration:** Configured a Sanity client using the following setup
- **Environment Variables:**
  - Required variables were added for both local development and deployment on Vercel:
    - NEXT\_PUBLIC\_SANITY\_PROJECT\_ID
    - NEXT\_PUBLIC\_SANITY\_DATASET
    - SANITY\_API\_TOKEN
- **Checking API Data on Thunder Client:**

## 2. Schema Adjustments

- **Schema Creation:**
  - Created custom schema types within Sanity Studio to define content structures.
- **TypeScript Integration:**
  - Added TypeScript interfaces for type safety when working with Sanity data.
- **Validation Rules:**
  - Defined validation rules for Sanity content fields to ensure data integrity.

- **Guidance From Given Schema:**

- Notice some main fields which were missing in my schema like availability & description.

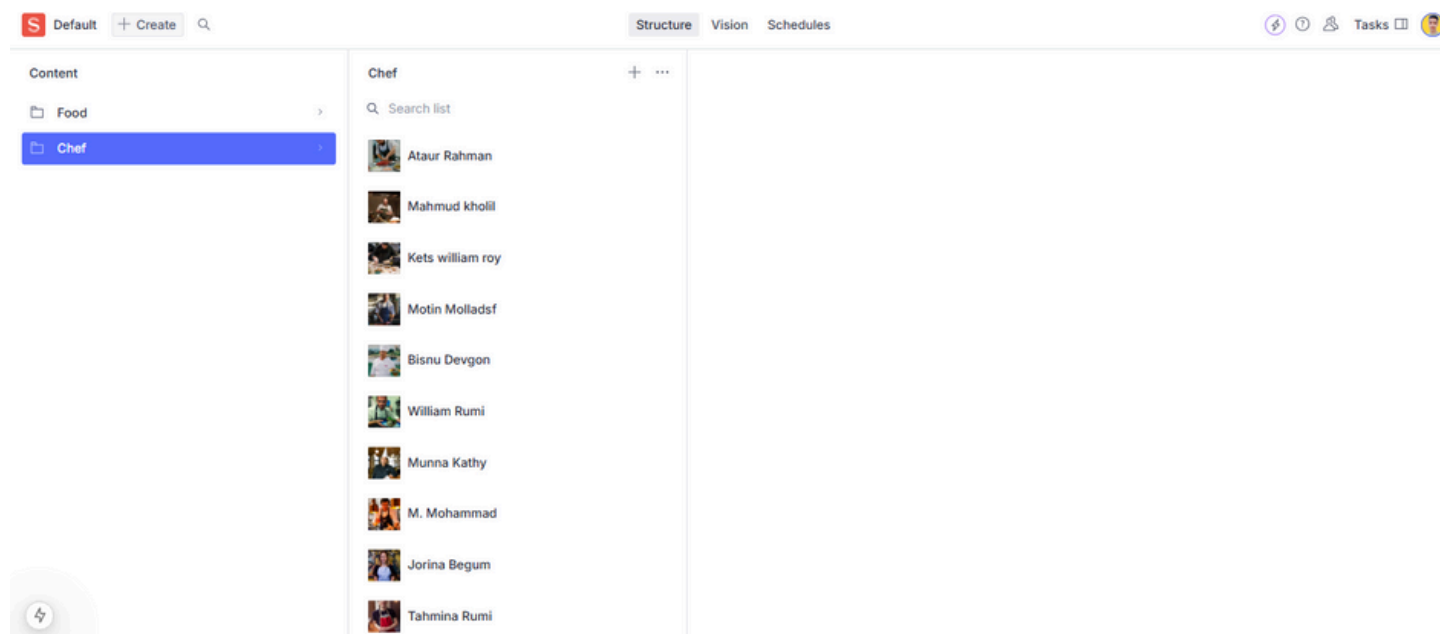

- **Making New Schema:**

- Made a new schema by combining my schema and the schema provided.

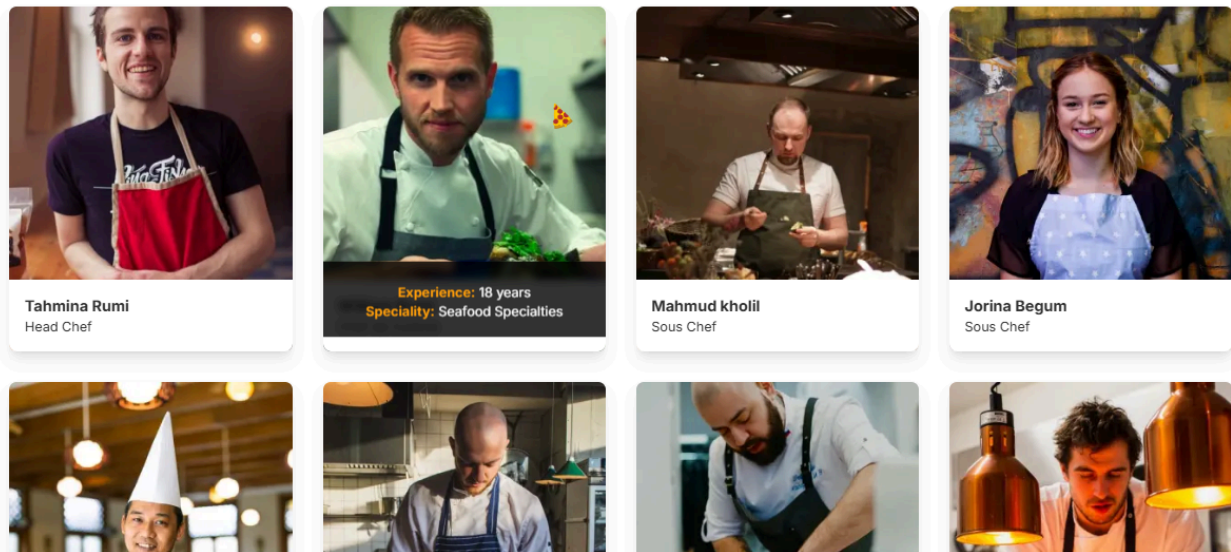

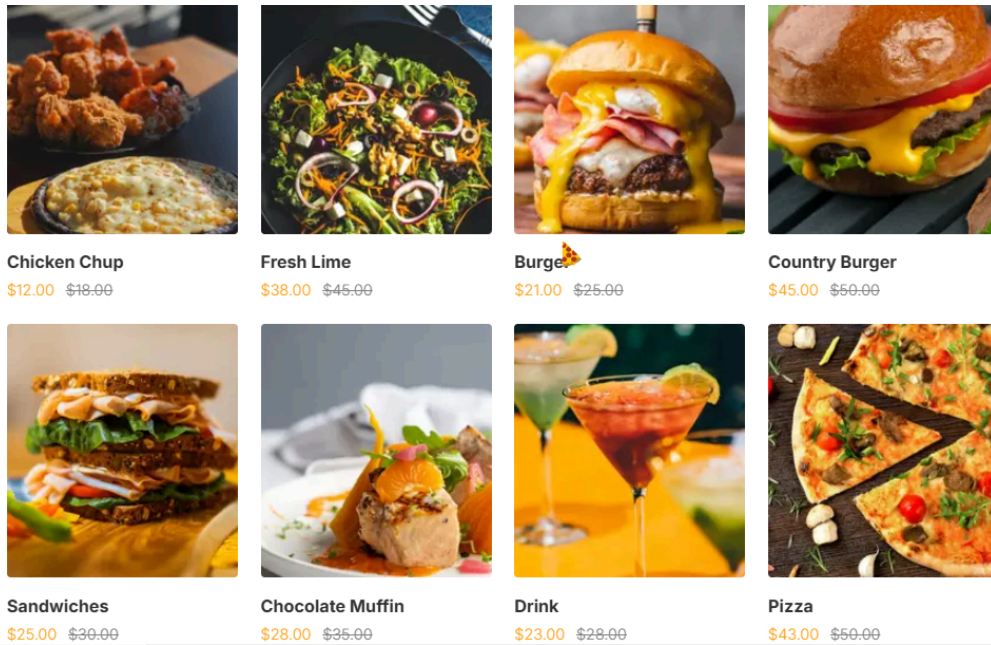

### 3. Migration and Optimization

- **Next.js Version:** Used Next.js 15 latest version to enhance capabilities.
- **Font Optimization:** Implemented next/font to streamline font loading and improve performance.
- **Deployment:** Leveraged Vercel as the deployment platform for seamless CI/CD integration and hosting.
- **Pushing Documents to sanity:**

pushed the documents to sanity through scripts available on my [github repo](#) in root/src/scripts

- **Fetching from Sanity:** After Pushing all documents from api to sanity, the next task is to display documents on frontend, following are some sanity documents fetched and displayed on frontend:

## Tools Used

- **Next.js:** Frontend framework for building the application.
- **Sanity CMS:** Content management system for managing and delivering data.
- **TypeScript:** Ensured type safety and reduced runtime errors.
- **ThunderClient:** For Testing API within VSCode through thunder client's extension
- **Vercel Platform:** Hosted the application with automated builds and deployments.
